AND SO MUCH MORE!

Profile: Webber Electronics

By Joe Tito

In the power cord business, there is very little room for error. Specifications tighten, compliance requirements evolve, and logistics can shift overnight. And customers; whether they are hospitals, OEMs, or defense contractors, expect the product to work every time.

Webber Electronics was built with that reality in mind. Founded in the early 1990s in the basement of Rick and Trish Webber's home, the company began by solving a specific challenge: supplying higher-quality hospital-grade power cords at a time when regulatory expectations were becoming more demanding. Rick Webber, drawing on nearly two decades of experience at Belden, recognized that reliability and compliance were not just boxes to check; they were differentiators.

That focus on doing it right from the beginning became the foundation of the company, and it still shapes how Webber operates today.

"At the time, hospitals were starting to demand higher standards for power cords," Jamie Wiggs, COO at Webber, explained. "My dad saw that coming and realized there was an opportunity to do it better."

Today, Webber Electronics specializes in standard power cords

Students Take Aim at Wire Harness Automation

University of British Columbia team experiments with a '3D printer' concept for routing and cutting wire harnesses

Every once in a while, something unexpected crosses my desk.

Recently I received a call from Gourbonn "Bonn" Herrera, an undergraduate student at the University of British Columbia who is part of the school's New Venture Design program. The program brings engineering and business students together to develop start-up-style technology ventures as part of their final-year coursework.

Bonn and his teammates, Dundee Wang, Zachariah Joseph, Owen Wang, Vidur Sahni and Yi Jia Zhou, are developing a technology platform they call SonicWire, which aims to automate portions of wire harness production while also simplifying how engineers source harness assemblies.

Their concept is straightforward to describe but ambitious in scope. The team is working toward a system that functions somewhat like a 3D printer for wire harnesses, capable of automatically routing and cutting wires according to a harness schematic.

The idea grew out of Dundee's experience working in the electric vehicle and drone industries. During internships at Tesla and the delivery-drone company Zipline, he was surprised by how much of the harness manufacturing process still depends on manual labor.

Back row, left to right: Bonn Herrera, Zach Joseph, Yi Jia Zhou. Front row, left to right: Dundee Wang, Owen Wang.

"Everybody's still building these harnesses by hand on a jig board," Dundee explained. After encoun-
